### Abstract

*Phellinus* Quel. is a member of family Hymenochaetaceae of the order Hymenochaetales. This genus comprises wood-inhabiting, saprophytic and parasitic species. Species of *Phellinus* sensu lato are known to have large host range and cause white rot of various types to live standing or dead trees from all over the world. The current study is based on a thorough study of literature to document the host range of *Phellinus* species from India. The study indicated that one hundred and seventy four plant species from 51 families are found to be infected by *Phellinus* species. The families found to be the most affected are Fabaceae, Combretaceae, Meliaceae, Dipterocarpaceae, Anacardiaceae, Myrtaceae, Meliaceae, Lauraceae, Fagaceae, Rosaceae. Many plant (tree) species are affected by *Phellinus*; this establishes it as a potential pathogen and wood decay fungi. The present study also reports *Phellinus* from almost all over India and every climatic zones. This indicated the high tolerance and acclimatization of *Phellinus* towards diverse climatic conditions. The most affected host is *Artocarpus* followed by *Terminalia* and *Acacia*. Although the study reports *Phellinus* from diverse climatic zones of India, the most affected families and genera are from moist tropical conditions. This indicates that *Phellinus* has vigorous activity in warm and moist areas and affects diverse plant/tree species in these areas like Maharashtra and Kerala. The states like Uttar Pradesh, Bihar, Jharkhand, Odisha, Rajasthan, Karnataka, Andhra Pradesh, Telengana, Union Territories, Manipur, Mizoram and Nagaland are still left to be explored. The present study has key significance in biodiversity, medicinal as well as the pathogenic study of *Phellinus*. It provides an overall host range of genus *Phellinus*, confirming its vast host diversity. The information could further be used in disease, biodiversity and plant pathological assessments.

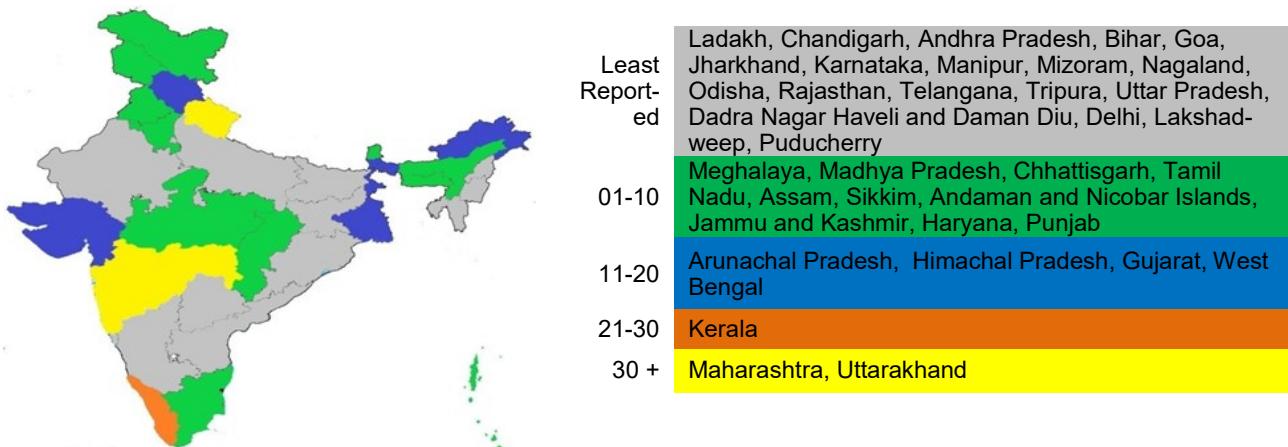

**Keywords:** Hymenochaetaceae, Host range, Indian species, Plant families, Wood inhabiting fungi

### INTRODUCTION

*Phellinus* s. l. is one of the largest of genera of basidiomycetes belonging to the Hymenochaetaceae, Hymenochaetales. This comprises wood-inhabiting, saprophytic and parasitic species which are characterized by xanthochoric reaction, presence of parenthesome in dolipore septa, frequent occurrence of setae, absence of clamps and production of white rotted wood in angiosperm and gymnosperm (Wanger and Fischer, 2001, 2002; Saha et al., 2018; Bala et al., 2019).

Fruiting bodies of *Phellinus* s.l. are mostly perennial,

rarely annual or biennial, brown to black, resupinate, pileate, corky to woody hard, with a crustose or tomentose pileal surface. Pores are mostly small, shining in some species. Hyphal system is dimitic, monomitic in a few species, and generative hyphae are hyaline to pale yellowish, thin-to thick-walled, encrusted by crystals or not; skeletal hyphae are brown, thick-walled. Setae or cystidioles are present or absent. Spores are subglobose, ellipsoid or cylindric, hyaline to yellowish or brown, thin-to thick-walled, mostly IKI-negative, CB negative or positive (Larsen and Cobb-Poule, 1990; Saha et al., 2018; Mohan et al., 2020).

**Fig. 1.** Map of India showing state-wise abundance on the basis of the number of *Phellinus* species in India (Source: Based on present study).

Species of *Phellinus* s. l. are lignicolous, causing white rot by degrading mainly the lignin and cellulose living of trees and dead wood, fallen trunks, stumps, and rotten wood. Species of *Phellinus* decay heartwood and cause root rot and cankers of live standing trees, destroy slash and other woody residues. No other class of forest diseases cause more timber damage than root rot and heart rot. Genus *Phellinus* is probably responsible for more timber loss than any other genus of wood-decaying fungi (Larsen and Cobb-Poule, 1990; Saha et al., 2018; Chander and Pathania, 2019; Mohan et al., 2020). Although species of *Phellinus* are notorious for causing white rot of wood and destroying timber but in natural forest ecosystem, they play important role as primary decomposers and help to mobilize lignin as well as the complex polysaccharides of wood and prove useful in terms of forest productivity and stabilization particularly in those forests where organic matter is produced at higher rate that can be recycled by natural process of decomposition (Adaskaveg and Ogawa, 1990). These species of *Phellinus* s. l. are reported and studied for their medicinal properties (Dai, 2010; Yan et al., 2017; Azeem et al., 2020; He et al., 2021).

The species are present from temperate to tropical zones. This is a large cosmopolitan group among polypores with 479 records of known species including forms and varieties (Anonymous, 2020) with host specific species and non specific saprotrophs (Larsen and cobb-Poule, 1990). 101 species of *Phellinus* s. l. are reported from India by various workers (Bagchee, 1953, 1961; Bakshi, 1955, 1971; Ganesh and Leelavathy, 1986, 2000; Vaidya, 1987; Hakimi, 2008; Mohanan, 2011; Sharma, 2012; Azeem and Dhingra, 2017; Saha et al., 2018; Mohan et al., 2020). Indian *Phellinus* s. l. species are reported to be found on different host species. In this study thorough study of Indian literature was done to assess wide range of host species of *Phellinus* s. l.

#### Host range of *Phellinus* sensu lato

A thorough study of Indian literature from the year 1955 (Bakshi, 1955) to year 2020 (Mohan et al., 2020) was made. Taxonomic studies and reports of different workers on Indian *Phellinus* species for past 75 years were thoroughly studied to generate detailed and pertinent list of host range of *Phellinus* sensu lato in India.

Table 1 shows that *Phellinus* sensu lato has a broad host range having 174 host species (Angiosperm and Gymnosperm). The Data establishes *Phellinus* species as vigorous and potential pathogens. This also shows the adaptation strategies of *Phellinus*, as this genus is found in every climatic zone of India and to survive and thrive in these climatic conditions. The *Phellinus* species are reported from all over India.

Most affected genera amongst host range are *Artocarpus*, *Terminalia*, *Acacia*, *shorea*, *Dalbergia*, *Albizia*, *Quercus*, *Gliricidia*, *Anogeissus*, *Betula* and *Mangifera* are given in Table 2. From the data, it is clear that most affected genera are from moist and warm tropical climatic conditions. This finding supports the fact that *Phellinus* species are growing vigorously in moist and warm climates and affect tropical plant species. In tropical conditions, *Phellinus* species grow vigorously on different hosts and show less host specificity than temperate climatic conditions where *Phellinus* species show more host specificity and grow vigorously on specific hosts.

*Fabaceae* has the maximum numbers of genera infected by *Phellinus* sensu lato, followed by *Meliaceae*, *Mirtaceae*, *Pinaceae*, *sapindaceae*, *moraceae*, *dipterocarpaceae*, *Lauraceae*, *Euphorbiaceae* and *Malvaceae* (Table 3). *Fabaceae* family got severely affected by *Phellinus* attack. Twenty two species of family got infections from different species of *Phellinus*. As genus *Phellinus* is wood decaying fungus, it completely destroys the tree's mechanical strength and makes it hollow from inside. The species of family *Fabaceae* might

**Table 2.** Showing dominantly infected genera amongst the host range of *Phellinus* (Source: Analysis based on Table-1.)

Sr. No.	Genus	Family	No. of <i>Phellinus</i> species inducing infection
1.	<i>Artocarpus</i>	Moraceae	21
2.	<i>Acacia</i>	Combretaceae	18
3.	<i>Terminalia</i>	Fabaceae	18
4.	<i>Shorea</i>	Dipterocarpaceae	14
5.	<i>Dalbergia</i>	Fabaceae	10
6.	<i>Albizia</i>	Fabaceae	9
7.	<i>Quercus</i>	Fagaceae	9
8.	<i>Gliricidia</i>	Fabaceae	8
9.	<i>Anogeissus</i>	Combretaceae	8
10.	<i>Betula</i>	Betulaceae	7

have very poor resistance towards *Phellinus* attack and contain some nutrients that attract this fungus towards the species of this family. Wood decaying fungi affects plant species when they get external injuries and spores of these pathogenic fungi enter the tree system through injured sites. Most plants from Fabaceae are urban avenue trees that are often subjected to stress and external injuries, making them vulnerable for fungal attacks.

Species wise abundance in states like Uttarakhand, Maharashtra and Kerala (Fig. 1) indicated that various workers had done the taxonomic work in these areas. The areas like Uttar Pradesh, Bihar, Jharkhand, Odisha, Rajasthan, Karnataka, Andhra Pradesh, Telengana, Union Territories and North Eastern states like Manipur, Mizoram and Nagaland are the areas where least number of species are reported and are least explored. Extensive work of taxonomy and species reporting requires to be done in these areas. Areas like Maharashtra, Uttarakhand, Kerala, Himachal Pradesh, Arunachal Pradesh, Gujarat and West Bengal with the highest availability of *Phellinus* species are properly explored and show perfect environment conditioned to have maximum diversity of *Phellinus* species.

## Conclusion

The present study concluded that *Phellinus* as a potential pathogen affects many species of plants belonging to different families. The Most affected genus is *Artocarpus* followed by *Acacia*, *Terminalia*, *Shorea*, *Dalbergia*, *Albizia*, *Quercus*, *Gliricidia*, *Anogeissus* and *Betula*. The most affected families are Fabaceae with twenty-two genera followed by Meliaceae, Myrtaceae, Pinaceae, Sapindaceae, Moraceae, Dipterocarpaceae, Lauraceae, Euphorbiaceae and Malvaceae. It

**Table 3.** Showing family wise susceptibility assessment of infection (Source: Analysis based on Table-1).

Sr. No.	Family	No. of infected genera
1.	Fabaceae	22
2.	Meliaceae	5
3.	Myrtaceae	4
4.	Pinaceae	4
5.	Sapindaceae	4
6.	Moraceae	3
7.	Dipterocarpaceae	3
8.	Lauraceae	3
9.	Euphorbiaceae	3
10.	Malvaceae	3

can affect hosts in different climatic conditions. Tropical moist climatic conditions make this fungus more vigorous and is most apt for its growth. Some species like *Artocarpus heterophyllus*, species of *Acacia*, *Terminalia*, *Shorea robusta*, *Dalbergia sissoo*, *Albizia lebbeck*, and *Quercus* species, *Gliricidia sepium* with weak system and low resistant subjected to stress and external injuries are more prone to genus *Phellinus* attack. Availability of *Phellinus* species to particular regions indicates that the work done in areas like Maharashtra, Uttarakhand, Kerala, Himachal Pradesh, Arunachal Pradesh, Gujarat and West Bengal pertains to the taxonomy of *Phellinus*. The states like Uttar Pradesh, Bihar, Jharkhand, Odisha, Rajasthan, Karnataka, Andhra Pradesh, Telengana, Union Territories, Manipur, Mizoram and Nagaland which are still left to be explored yet. This study could be the base-line data to explore these areas by taxonomists regarding the availability of *Phellinus* species. It could be helpful in the future to study *Phellinus* sensu lato and its hosts for its biodiversity, medicinal and pathological findings.

### Conflict of interest

The authors declare that they have no conflict of interest.
